Details

GENERAL DESCRIPTION:

Glass industry consumes huge energy every year. China’s technology has a top level in the float glass processing industry. But there is still room to be improved in energy consumption. Our float glass kiln waste heat boiler can further utilize the waste heat more than 70% so the waste heat is almost fully used.

The development of float glass furnace flue gas waste heat boiler overcomes the traditional heat pipe waste heat boiler defects in structure and operation. This type of product is simple in operation, less maintenance, economic, safe and reliable. Also it has a long time working life.
